

**ABSTRACT**

A switch device is configured by engaging a plurality of switches in a cam section of an operating member in a manner such that a detecting section can detect positions of operation of the operating member based on electric ON/OFF states of the switches. With this arrangement, it is possible to detect the positions of operation of the operating member by only detecting the electric ON/OFF states of the switches wherever position of operation the operating member may be. Consequently, a switch device that is simple in construction and capable of surely detecting positions of operation of the operating member can be provided.
